

How do you protect and control sensitive business information on personal devices?

Providing company-issued devices to employees is expensive. On the other hand, asking people to deploy mobile device management (MDM) software on their personal devices may be viewed as intrusive.

At the same time, people are on-the-go and need to instantly access company data and communicate on business topics from their smartphones. This results in major challenges related to security, privacy and control of sensitive business information.

Zero-trust

Granular data enforcement ensures you do not have to trust the security practices or behaviors of others.

Zero-knowledge

No one (including LockDown) can see your data without your permission.

Introducing a new standard for protecting and controlling company data on personal devices

LockDown enables employees to securely communicate and access documents on their personal smartphones and computers through an easy-to-use app. The LockDown app is a private collaboration environment that is controlled by the business.

LockDown provides businesses with ability to ensure that only the right people - inside and/or outside your company - can safely message and share documents. Proprietary encryption and key handling technologies automatically enforce your security, permissions and access control policies.

With the easy-to-use LockDown app, you can:

- ✓ Utilize powerful technology to enforce your policies, rather than only relying on agreements or blind trust.
- ✓ Provide access to information to specific people and for specific periods of time - and you can revoke access at any time.
- ✓ Control whether data can be forwarded, printed, edited, copied or downloaded/exported.
- ✓ Track who views your documents, as well as when and how often, in real time.
- ✓ Instantly and permanently remove access to all data at any time.

You no longer have to choose between protecting your data and sharing it.
